

Assignment 2 Case Study

Stage 2 Tutorial From Problems to Requirements

Week 5 | 60 minutes

Learning goals

- Analyse stakeholders.
- Distinguish functional and non-functional requirements.
- Recognise ambiguity and unsupported requirements.
- Define scope.
- Develop user stories and acceptance criteria.
- Critique AI-generated requirements.

Activity 1 - Stakeholder Map

Stakeholder	Need	Potential conflict
Practitioner	View availability, see who's booked in, access patient records	Wants detailed patient/appointment information, while privacy and simplicity may limit what is displayed.
Client	Book, cancel, view appointments and information stored safely	Wants convenient booking and changes, while the clinic needs rules to prevent duplicate bookings and manage availability.
Clinic Manager	Reliable appointment records, practitioner availability and see reports.	May want more reporting and functionality, increasing system complexity beyond the desired simple first version.
Receptionist	Quickly, modify, create and access appointments and locate records.	Wants flexibility to make changes, while the system needs controls to prevent errors and duplicate bookings.
System administrator	Secure, easy and reliable user access with easy maintenance	Security and access controls may make the system less convenient for some users.

Activity 2 - Functional or Non-Functional?

- ☒ Functional ☐ Non-functional The system shall allow staff to cancel an appointment.
- ☐ Functional ☒ Non-functional The system should remain responsive for the course-scale dataset.
- ☐ Functional ☒ Non-functional The system shall retain cancelled appointments.

☐ Functional ☒ Non-functional Core business logic should be independently testable.

☒ Functional ☐ Non-functional The system shall search for a patient by ID.

Activity 3 - Repair Ambiguous Requirements

The system should be easy to use.

Problem: Easy to use Clarification question: What criteria should the program meet to be easy to use?

Patient search should be fast.

Problem: Fast Clarification question: How quickly should the system return a patient result?

The system should securely manage data.

Problem: Securely Clarification question: What is meant by securely?

Appointments should normally be easy to cancel.

Problem: Normally and easy Clarification question: Who should be able to cancel appointments, and what steps should be required to cancel one?

Activity 4 - AI Requirements Audit

Classify each suggestion: Confirmed / Assumption requiring validation / Unsupported / Out of scope.

AI suggestion	Classification	Evidence / reason
Patients receive SMS reminders.	Assumption requiring validation	The case study does not mention SMS reminders. It could be useful, but there is no evidence that SmartCare wants this feature.
Facial recognition login.	Out of scope	The case study asks for a simple appointment system and does not indicate a need for facial recognition.
Receptionists create appointments.	Assumption requiring validation	The case study mentions manual appointment processes but does not explicitly state that receptionists will use the new system to create appointments. This should be confirmed with SmartCare.
Online payment.	Out of scope	The case study focuses on patient, practitioner and appointment management. Payments are not included in the stated initial scope.
Practitioners view schedules.	Confirmed	The case study not being able to view the appointment schedule as a current problem
AI recommends treatments.	Unsupported	Nothing in the case study says AI should recommend treatments,

		this is also unethical.
Cancelled appointments remain in history.	Confirmed	The case study identifies a lack of reliable appointment history as a problem, supporting the need to retain appointment history, including cancellations.

Exit question

Why is 'AI suggested it' not sufficient evidence for a requirement?

As AI lacks evidence to make the correct decision.
